

Vector Store Cache TTL and Invalidation Protocols

Vector Store Cache TTL and Invalidation Protocols

Document ID: doc_28_cache_invalidation

Topics: cache, invalidation, ttl

1. Overview

This technical specification details vector store cache ttl and invalidation protocols within the MCPPRO orchestration platform.

Detailed sections cover architectural contracts, runtime memory budgets, error handling semantics, and telemetry capture.

2. Implementation Details

The subsystem is encapsulated in the MCPPRO codebase, offering high-throughput, low-latency execution interfaces.

Default parameters are configured for enterprise stability and scalable vector retrieval.

3. Validation and Benchmarking Standards

All performance assertions must be validated through automated benchmark suites recording latency percentiles (mean, p50, p90, p95, p99), error rates, and resource utilization.
